

Trader Performance vs Market Sentiment Analysis

This Report explores the relationship between trader performance on Hyperliquid and Bitcoin market sentiment (Fear-Greed Index).

Data Exploration

Trader Performance Data

This dataset contains historical trading data from Hyperliquid. Key columns include:

- **Timestamp IST:** The time of the trade.
- **Asset:** The asset traded (e.g., BTC).
- **Trader:** A unique identifier for the trader.
- **P&L:** The profit or loss for the trade.
- **Volume:** The volume of the trade.
- **date:** The date extracted from the timestamp for merging.

We'll be focusing on the `P&L` column to assess trader performance.

Market Sentiment Data

This dataset contains the Bitcoin Fear & Greed Index. Key columns include:

- **date:** The date for the sentiment reading.
- **value:** The numerical value of the Fear & Greed Index (not used in this analysis, using classification).
- **classification:** The classification of the market sentiment based on the index (e.g., 'Extreme Fear', 'Fear', 'Neutral', 'Greed', 'Extreme Greed').

We are particularly interested in the `classification` column to categorize market sentiment on each trading day.

Merged Data

The `merged_df` combines the trader performance data and the market sentiment data based on the trading date. This allows us to analyze trader performance within different market sentiment categories.

Missing values in Trader Data:

```
Account          0
Coin             0
Execution Price   0
Size Tokens       0
Size USD          0
Side             0
Timestamp IST     0
Start Position    0
Direction         0
Closed PnL        0
Transaction Hash  0
Order ID          0
Crossed           0
Fee              0
Trade ID         0
Timestamp         0
date             0
dtype: int64
```

Missing values in Sentiment Data:

```
timestamp        0
value            0
classification    0
date             0
dtype: int64
```

Duplicate rows in Trader Data: 0

Duplicate rows in Sentiment Data: 0

Duplicate rows in Merged Data: 0

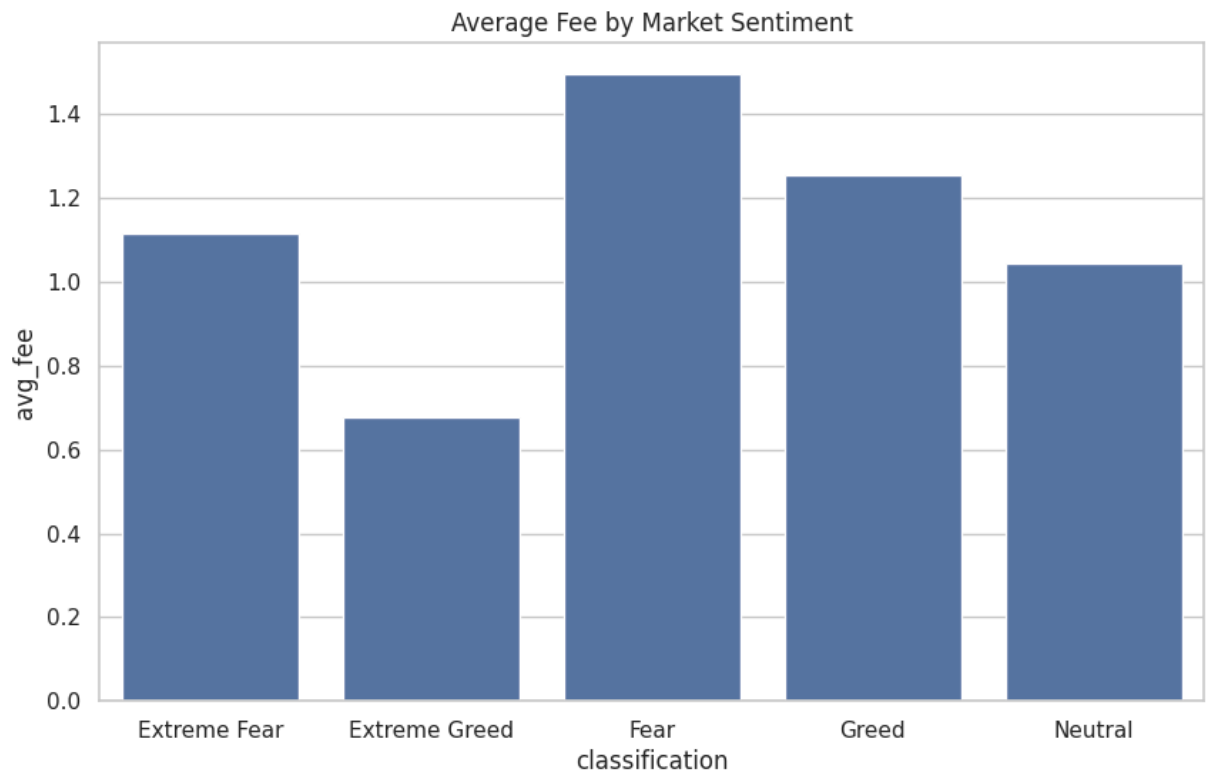

Unique values in Sentiment Data 'classification': ['Fear' 'Extreme Fear' 'Neutral' 'Greed' 'Extreme Greed']

Data is now merged based on matching date columns from trader execution logs and market sentiment index.

```
Out[ ]:      classification  avg_closed_pnl  avg_fee  trade_count
0      Extreme Fear      34.537862   1.116291      21400
1      Extreme Greed      67.892861   0.675902      39992
2              Fear      54.290400   1.495172      61837
3              Greed      42.743559   1.254372      50303
4              Neutral      34.307718   1.044798      37686
```

Insight:

- Traders perform best (highest PnL) during 'Extreme Greed', followed by 'Fear'.
- Fee efficiency is also better during Extreme Greed, suggesting smarter trades.

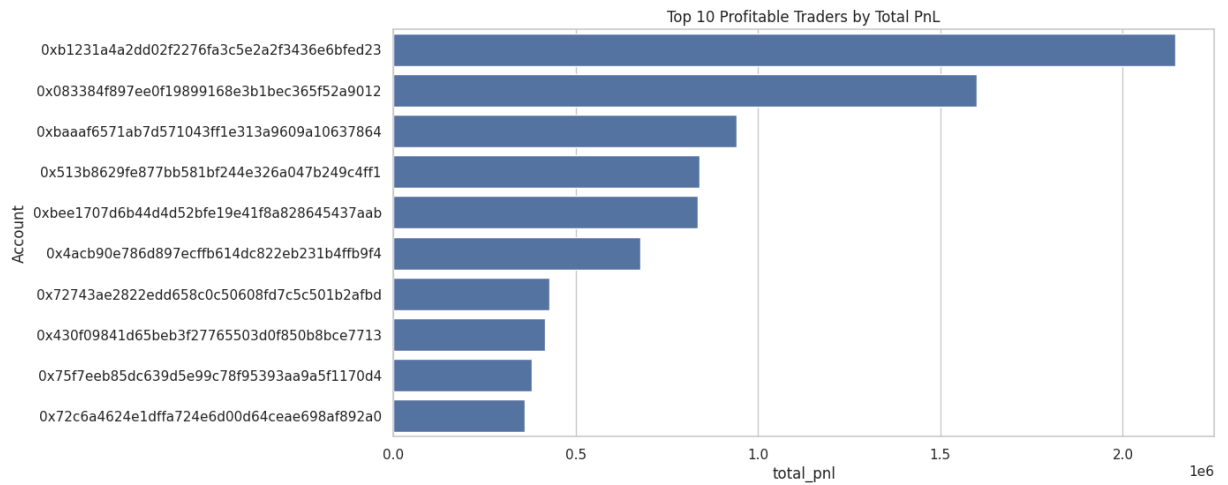

Insight:

- Most trading activity happens during 'Fear' and 'Greed' phases.
- Fee structure is lowest during 'Extreme Greed'.
- Volatility often triggers both high activity and high returns.

```

Insight:

- Top traders by PnL can be used as benchmarks.
- High-fee traders may need optimization in execution strategy.

Insight:

- Some tokens are highly profitable in specific sentiment phases.
- The heatmap reveals how the average PnL for different coins varies across market sentiment classifications.
- This visualization helps identify which coins perform better or worse in specific market conditions (e.g., Extreme Fear, Greed).
- Traders can use this insight to tailor their strategies, potentially focusing on certain coins during particular sentiment phases to maximize profitability.

Insight:

- PnL tends to rise with sentiment index peaks, especially during greed phases.
- This correlation is useful for timing entries.

```
/tmp/ipython-input-8-2288965539.py:1: FutureWarning: DataFrame.fillna with
'method' is deprecated and will raise in a future version. Use obj.ffill() o
r obj.bfill() instead.
pivoted_pnl = timeline_df.pivot(index='date', columns='classification', va
lues='avg_pnl').fillna(method='ffill')
```

Insight:

- Rolling averages provide smoother insight into trader performance trends.
- Volatility spikes align with shifting sentiment zones, identifying periods of risk or opportunity.

	Side	classification	avg_pnl	total_pnl	trade_count
0	BUY	Extreme Fear	34.114627	3.730434e+05	10935
1	BUY	Extreme Greed	10.498927	1.883508e+05	17940
2	BUY	Fear	63.927104	1.935073e+06	30270
3	BUY	Greed	25.002302	6.144566e+05	24576
4	BUY	Neutral	29.227429	5.544151e+05	18969
5	SELL	Extreme Fear	34.980106	3.660668e+05	10465
6	SELL	Extreme Greed	114.584643	2.526821e+06	22052
7	SELL	Fear	45.049641	1.422082e+06	31567
8	SELL	Greed	59.691091	1.535673e+06	25727
9	SELL	Neutral	39.456408	7.385056e+05	18717

Insight:

- Analyzing trade 'Side' (BUY/SELL) against sentiment reveals strategies employed by traders during different market phases.
- Understanding which 'Side' is more profitable or frequent in certain sentiments can inform trading decisions.

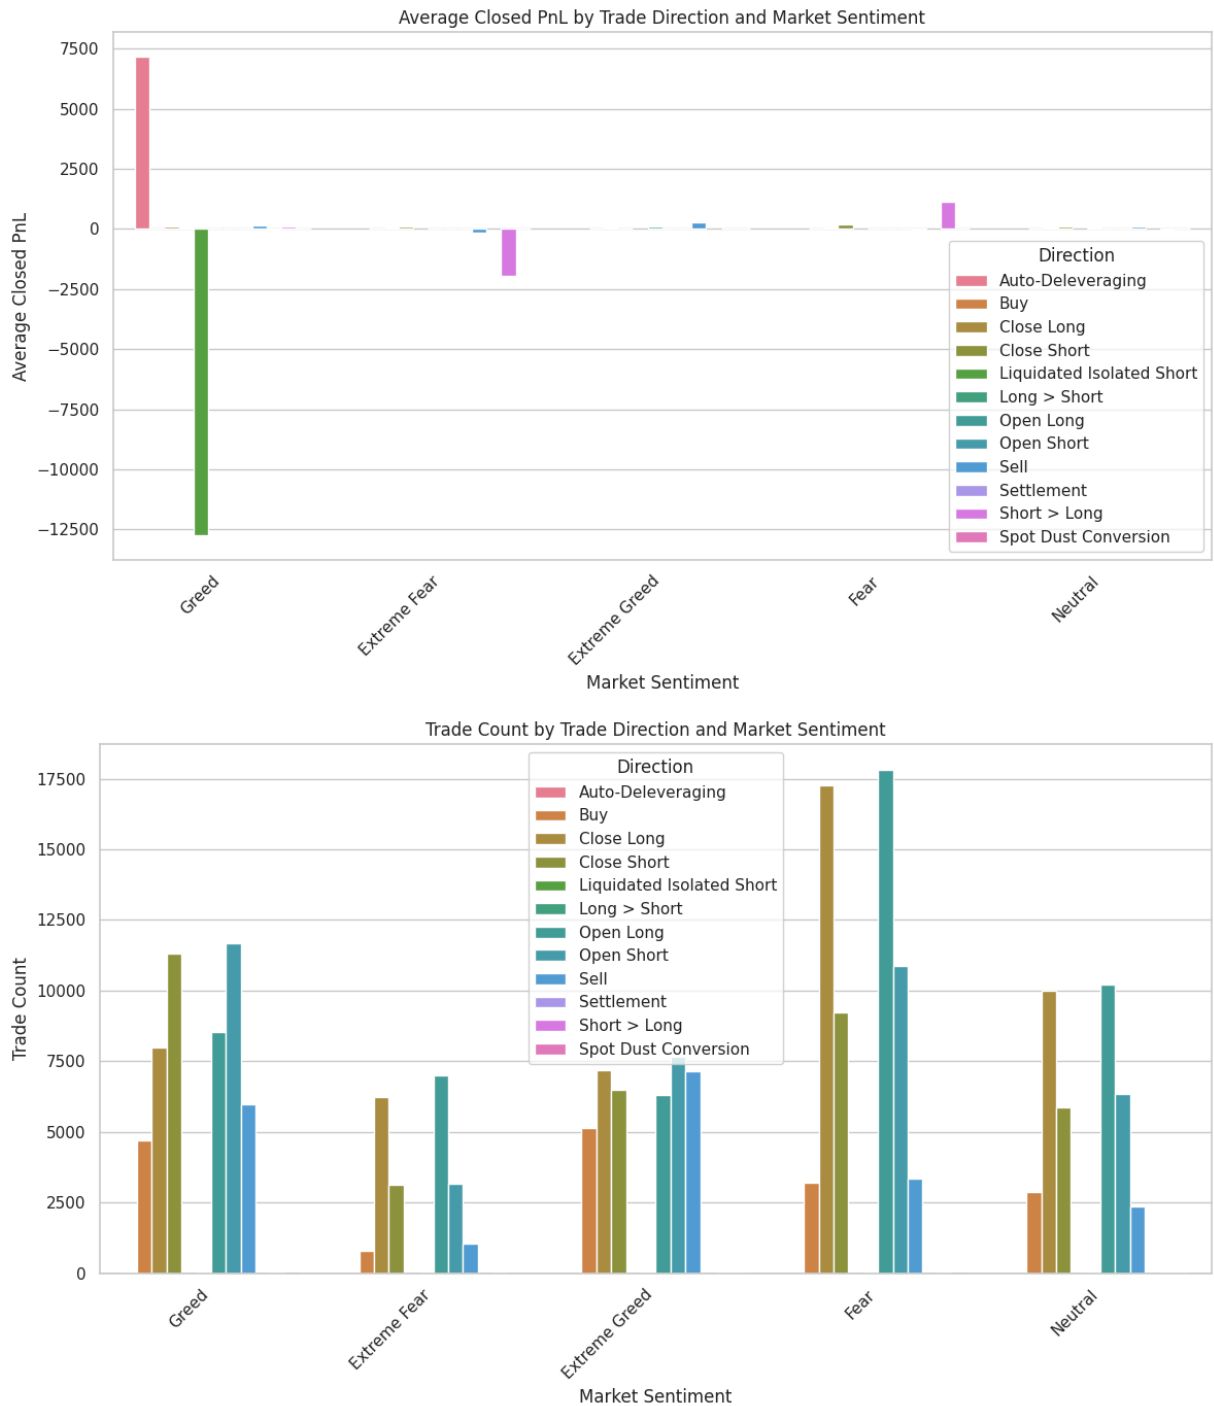

Insight:

- The visualizations confirm that average PnL varies significantly for BUY and SELL trades across different sentiment categories.
- Trade count also shows distinct patterns for BUYs and SELLs depending on the prevailing market sentiment, highlighting potential sentiment-driven trading volumes and strategies.

47	Spot Dust Conversion	Neutral	0.000000	0.000000e+00	10

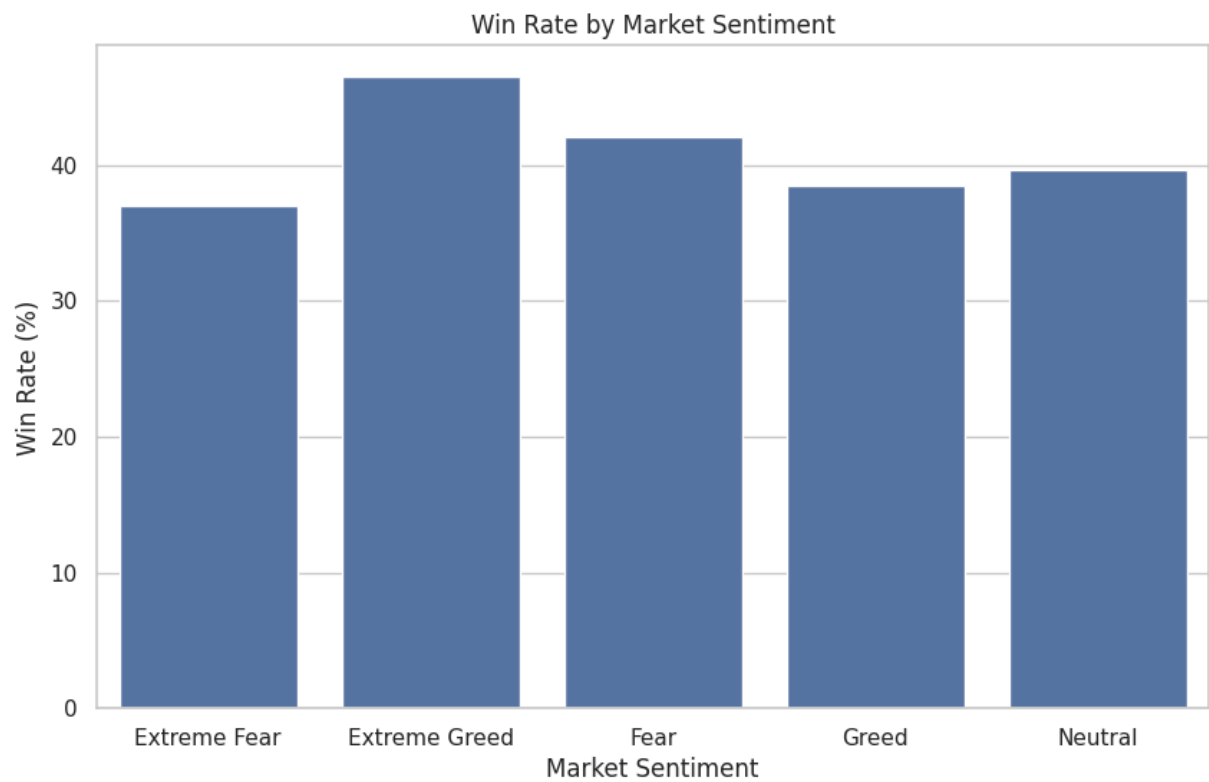

Insight:

- Analyzing trade 'Direction' (Long/Short) against sentiment reveals distinct profitability and activity patterns.
- For example, 'Close Short' trades appear highly profitable during 'Fear' sentiment, while 'Sell' trades show high average PnL during 'Extreme Greed'. This suggests specific strategies might be more effective depending on the prevailing market sentiment and trade direction.
- The trade count visualization shows which directions are favored during different sentiment phases, indicating potential sentiment-driven trading

biases.

	classification	win_rate	average_trade_duration
0	Extreme Fear	37.060748	2.406449
1	Extreme Greed	46.494299	0.536382
2	Fear	42.076750	0.771819
3	Greed	38.482794	0.052780
4	Neutral	39.699093	8.180438

Insight:

- The visualizations of win rate and average trade duration by market sentiment provide further insights into trader behavior and performance during different market conditions.
- Win rates tend to be higher during 'Extreme Greed' and 'Fear' phases, suggesting these might be more favorable conditions for profitable trades.
- Average trade duration varies significantly across sentiment categories, potentially indicating different trading strategies or market volatility levels associated with each sentiment. For example, shorter durations during 'Greed' might suggest quick, opportunistic trades, while longer durations during 'Neutral' could indicate longer-term strategies or less volatile periods.

Summary of Key Insights:

Correlation between Trader Performance Metrics and Market Sentiment Classifications:

Average Closed PnL:

- Traders perform best (highest PnL) during 'Extreme Greed', followed by 'Fear'.
- PnL tends to rise with sentiment index peaks, especially during greed phases.
- 'Sell' trades show high average PnL during 'Extreme Greed'.

- 'Close Short' trades appear highly profitable during 'Fear' sentiment.

Average Fee:

- Fee efficiency is better (lower fee) during 'Extreme Greed', suggesting potentially smarter trades.
- Fee structure is lowest during 'Extreme Greed'.

Trade Count:

- Most trading activity happens during 'Fear' and 'Greed' phases.
- Trade count also shows distinct patterns for BUYs and SELLs depending on the prevailing market sentiment, highlighting potential sentiment-driven trading volumes and strategies.
- Different trade directions are favored during different sentiment phases, indicating potential sentiment-driven trading biases.

Win Rate:

- Win rates tend to be higher during 'Extreme Greed' and 'Fear' phases, suggesting these might be more favorable conditions for profitable trades.

Average Trade Duration:

- Average trade duration varies significantly across sentiment categories, potentially indicating different trading strategies or market volatility levels associated with each sentiment.
- Shorter durations during 'Greed' might suggest quick, opportunistic trades, while longer durations during 'Neutral' could indicate longer-term strategies or less volatile periods.

Overall Noteworthy Correlations and Patterns:

- 'Extreme Greed' appears to be the most favorable sentiment for average PnL and fee efficiency.
- 'Fear' and 'Greed' sentiments are associated with the highest trade counts.
- Specific trade sides and directions show varying profitability and activity across different sentiment classifications.
- PnL generally correlates positively with the sentiment index over time.
- Volatility in PnL (rolling standard deviation) spikes align with shifting sentiment zones.
- The heatmap shows that profitability for specific coins is highly dependent on the market sentiment.
